

[Humans' Racial Biases Extend Even To Black And White Robots](#)

AI and the future of humans: Experts express concerns and suggest solutions

CONCERNS	<ul style="list-style-type: none">- Human agency: Individuals are experiencing a loss of control over their lives	Decision-making on key aspects of digital life is automatically ceded to code-driven, “black box” tools. People lack input and do not learn the context about how the tools work. They sacrifice independence, privacy and power over choice; they have no control over these processes. This effect will deepen as automated systems become more prevalent and complex.
	<ul style="list-style-type: none">- Data abuse: Data use and surveillance in complex systems is designed for profit or for exercising power	Most AI tools are and will be in the hands of companies striving for profits or governments striving for power. Values and ethics are often not baked into the digital systems making people’s decisions for them. These systems are globally networked and not easy to regulate or rein in.
	<ul style="list-style-type: none">- Job loss: The AI takeover of jobs will widen economic divides, leading to social upheaval	The efficiencies and other economic advantages of code-based machine intelligence will continue to disrupt all aspects of human work. While some expect new jobs will emerge, others worry about massive job losses, widening economic divides and social upheavals, including populist uprisings.
	<ul style="list-style-type: none">- Dependence lock-in: Reduction of individuals’ cognitive, social and survival skills	Many see AI as <i>augmenting</i> human capacities but some predict the opposite – that people’s deepening dependence on machine-driven networks will erode their abilities to think for themselves, take action independent of automated systems and interact effectively with others.
	<ul style="list-style-type: none">- Mayhem: Autonomous weapons, cybercrime and weaponized information	Some predict further erosion of traditional sociopolitical structures and the possibility of great loss of lives due to accelerated growth of autonomous military applications and the use of weaponized information, lies and propaganda to dangerously destabilize human groups. Some also fear cybercriminals’ reach into economic systems.
SUGGESTED SOLUTIONS	<ul style="list-style-type: none">- Global good is No. 1: Improve human collaboration across borders and stakeholder groups	Digital cooperation to serve humanity’s best interests is the top priority. Ways must be found for people around the world to come to common understandings and agreements – to join forces to facilitate the innovation of widely accepted approaches aimed at tackling wicked problems and maintaining control over complex human-digital networks.
	<ul style="list-style-type: none">- Values-based system: Develop policies to assure AI will be directed at ‘humanness’ and common good	Adopt a ‘moonshot mentality’ to build inclusive, decentralized intelligent digital networks ‘imbued with empathy’ that help humans aggressively ensure that technology meets social and ethical responsibilities. Some new level of regulatory and certification process will be necessary.
	<ul style="list-style-type: none">- Prioritize people: Alter economic and political systems to better help humans ‘race with the robots’	Reorganize economic and political systems toward the goal of expanding humans’ capacities and capabilities in order to heighten human/AI collaboration and staunch trends that would compromise human relevance in the face of programmed intelligence.

A study called “Robots and Racism,” the human tendency to stereotype racial bias is expanding into the world of robotics.. People treat white robots better than black robots, a recent study found. ... Gender and racial bias also factor into our treatment of robots.. Reading practice for GRE: Study: Humans' racial biases extend even to black and white robots.

people demonstrate a similar racial bias toward dark colored robots ... that there is a strong shooter bias towards Black males even when ... color (e.g., white, black) and extended human racial stereotypes to racialized robots.. Yes, says a study showing humans' biases extend to robots ... to have a race and therefore apply racial stereotypes to white and black robots. ... UBTECH's Walker, Boston Dynamics' Atlas, and even NASA's Valkyrie robot.. If you do a quick Google search for 'robot,' you'll be faced with a wall of white robots. According to a recent study called “Robots and Racism,” human's tendency As CNN points out, the robots depicted in media are “all made of shiny white material. ... “The bias against black robots is a result of bias against African-Americans,” said lead ... pandora's box that will lead to even more useless discussions about robots and race. ... To a certain extent, we've been waiting for this to happen.
